

# Batteries in parallel for communication base stations

## Overview

---

VRLA batteries use absorbed glass mat (AGM) technology for spill-proof operation, while lithium-ion variants offer higher energy density. This article clarifies what communication batteries truly mean in the context of telecom base stations, why these applications have unique requirements, and which battery technologies are suitable for reliable operations. Backup power for telecom base stations, including UPS systems and battery banks composed of multiple parallel rechargeable batteries has traditionally relied on lead-acid. Among various battery technologies, Lithium Iron Phosphate (LiFePO<sub>4</sub>) batteries stand out as the ideal choice for telecom base station backup power due to their high safety, long lifespan, and excellent thermal stability. This guide outlines the design considerations for a 48V 100Ah LiFePO<sub>4</sub> battery.

System Integration □ Integrate EMS / BMS / PCS / power distribution / battery / operation platform to provide one-stop system solutions

Independent Control □ Each group of batteries is independently controlled, without risk of circulation

Perfectly Compatible □ Compatible with mainstream batteries on the market. Intelligent communication energy system can support data information exchange and sharing in any scenario (indoor, outdoor), providing power energy solutions for base stations and communication equipment. This is especially relevant for equipment installed at remote locations, base stations, and mobile platforms.

## Batteries in parallel for communication base stations

---

### Application of LiFePO4 Batteries in Mobile and Base Communication ...

Connecting batteries with the same voltage in parallel creates a system capable of powering equipment longer without recharging. For example, one battery may have 100 Ah, while two in parallel provide ...
