

# Battery safety malawi

## Overview

---

Researchers at The University of Manchester have identified dangerous levels of lead pollution in Malawi due to informal recycling of lead- acid batteries from off-grid solar systems. As Malawi's solar sector scaled rapidly, so did its battery waste. Hundreds of thousands of batteries were deployed into a price-sensitive economy with no formal system to manage them when they fail. Recycled battery being reassembled with the reused negative plates and fabricated positive plates wrapped in plate. Malawi was bringing more solar power onto the grid but instability, with frequent nationwide outages disrupted homes, businesses, and essential services. “We only get electricity for 5 hours daily in this township. Our stored food and medicines go bad quickly,” she.
