

Caracas microgrid economics

Overview

The diesel generators in the microgrid are networked to allow parallel operation and coordinated dispatch for loads interconnected within a facility's distribution system. This study provides an approach to selecting DERs by evaluating their lifecycle costs and the resilience of a microgrid when microgrid power (PV), and battery energy storage systems (BESS). We focus on these DERs because they constraints. Decisions dating back two decades have brought about a dramatic decline in the generating capacity and reliability of the Venezuelan electricity system. Progressively worse blackouts since 2010 culminated in a week-long outage in early 2019. This groundbreaking system at the Redwood Coast Airport is the model project for PG over the past few decades, efficient, reliable and secure.
