

Chemical materials photovoltaic panels

Overview

While solar panels use mostly common materials with very low toxicity—glass and aluminum account for over 90 percent of a solar panel's mass—silicon-based solar panels use trace elements of lead for antireflective coating and metallization on solar cells inside the panel. Solar panels use few hazardous materials to begin with. When used, these materials come in very small quantities, and they are sealed in high-strength encapsulants that prevent chemical leaching, even when solar panels have been crushed or exposed to extreme heat or rainwater. Introduction: The Quantum Revolution and Why Chemistry Matters. Discover the key materials that make up modern monocrystalline solar panels, what role each material plays, and where these materials usually come from. What kind of home do you live in?

Polysilicon, made from silicon metal, is the key material used to make solar cells.
