

# Communication Imf manages several base stations

## Overview

---

The core module of LCS in 5G is the LMF, which manages the support of various positioning services. During the UE positioning process, the LMF first identifies the positioning methods and invokes the positioning tasks in the UEs and the related base stations in the. In this paper, we summarize the evolution of positioning standards in the Third Generation Partnership Project (3GPP) and briefly introduce the new positioning standards in 5G NR (New Radio), which include new positioning requirements, the general positioning structure, new positioning reference. AMF: The AMF is a key component in 5G networks. It manages mobility, session management, and security for user devices. It includes. Thanks to 3GPP Release 16, 5G rolls out advanced positioning systems that achieve sub-meter accuracy—which is crucial for things like self-driving cars, industrial automation, and emergency services. This release leverages the flexible structure of 5G NR, allowing for real-time location tracking of. Abstract—Despite the large attention achieved by 5G localization in standardization bodies, the integration of 5G network function modules designed for localization lacks experimental work. In this work, we. Receive configuration parameters of the positioning reference signal sent by the LMF entity wherein, the configuration parameters of the positioning reference signal include: a transmission period of the positioning reference signal, and/or, the positioning within each transmission period The offset. tion accuracy and precision. person and medical equipment location), shared bikes, aerial vehicles (drones), augmented r.

## Communication Imf manages several base stations

### WO2023072152A1

The present invention provides a positioning reference signal configuration method and device, a location management function (LMF), a base station, an AMF, and a terminal.
