

Core equipment for solar thermal power generation

Overview

All solar thermal power systems have solar energy collectors with two main components: reflectors (mirrors) that capture and focus sunlight onto a receiver. Our power generation equipment and instrumentations and controls enable plant operators to make highest efficient use of every single sun beam. In CSP plants, mirrors reflect and concentrate sunlight onto a focused point or line where it is collected and converted into heat, which can be stored and used to produce electricity. Solar thermal-electric power systems collect and concentrate sunlight to produce the high temperatures needed to generate electricity. In most. At the core of every solar power generation system lies the PV (photovoltaic) inverter—a crucial piece of equipment that converts the direct current (DC) electricity produced by solar panels into alternating current (AC), making it suitable for household and industrial use. This selective range of wavelength depends on the materials of the solar cells.

Core equipment for solar thermal power generation

Solar thermal storage power generation equipment

Concentrating solar thermal power systems such as LFR and PTC can be used for digesting and captive power generation. The different qualities of steam can be withdrawn from different locations of the ...
