

Generator room exhaust shaft distance from ground

Overview

A 9 inch spacing (10 inches (250mm) recommended) from the exhaust pipe and walls is also required by most local codes. Piping and mufflers must be properly supported. The height of the wall and distance of the wall from the generator was systematically varied for this test case to determine the influence. The wall height was twice. The air inlet must be capable of moving enough air through the room to provide the correct minimum CFM (cubic feet per minute) cooling for generator as specified by the generator's manufacturer. (This means the generator's air inlet opening size will be greater than the generator's room exhaust fan. Generator room air inlet and outlet shaft spac velocities and a louver free area of 50% is used. Tight ceiling spaces, structural beams, and conflicts with other HVAC or plumbing trades can quickly complicate the installation. The result?

Longer pipe runs and numerous changes in direction, all leading to excessive exhaust.

Generator room exhaust shaft distance from ground

Generator room air inlet and exhaust parameters

Proper ventilation of the generator room is necessary to support the engine combustion process, reject the parasitic heat generated during operation (engine heat, alternator heat, etc.), and purge odors and fumes.
