

# High voltage on the grid side of the inverter

## Overview

---

High voltage from the Utility Grid exceeding inverter specifications. Inadequate transformer or grid connection causing voltage spikes. This fault can occur due to excessive voltage from the Utility Grid, which may be a result of high. In a residential solar application, do inverters shut down if the grid voltage is too high?

If so, what are the rules or parameters for this?

Like, at what grid input voltage does the inverter shutdown?

If so, is this a universal rule here in the U. The voltage displayed by the inverter comes partly from photovoltaic modules, which is called DC voltage, and partly from the power grid, which is called AC voltage.

## How does a solar / PV inverter get preference over grid source for the

If the solar inverter sees a high grid voltage of let's say 250 volts, it does the same. Only when the grid voltage exceeds some sane limit, will the solar inverter stop production.
