

Local grid energy storage

Overview

Electricity storage is one of the three key ways to replace flexibility from fossil fuels in the grid. Other options are demand-side response, in which consumers change when they use electricity or how much they use. These systems help balance supply and demand by storing excess electricity from variable renewables such as solar and inflexible sources. Across the United States, battery energy storage is rapidly emerging from a niche technology into mainstream grid infrastructure.

Grid energy storage

Electricity can be stored directly for a short time in capacitors, somewhat longer electrochemically in batteries, and much longer chemically (e.g. hydrogen), mechanically (e.g. pumped hydropower) or as heat. The first pumped hydroelectricity was constructed at the end of the 19th century around the Alps in Italy, Austria, and Switzerland. The technique rapidly expanded during the 1960s to 1980s nuclear boom, ...
