

# North america northwest liquid flow energy storage project

## Overview

---

Researchers at the Pacific Northwest National Laboratory have made a breakthrough in energy storage technology with the development of a new type of battery called the liquid iron flow battery. A new recipe provides a pathway to a safe, economical, water-based, flow battery made with Earth-abundant materials RICHLAND, Wash. In the 1970s, scientists at the National Aeronautics and Space Administration (NASA) developed the first iron flow. The objective of SI 2030 is to develop specific and quantifiable research, development, and deployment (RD&D) pathways to achieve the targets identified in the Long-Duration Storage Shot, which seeks to achieve 90% cost reductions for technologies that can provide 10 hours or longer of energy. Over the last several decades, PNNL has seized the energy storage challenge and, in collaboration with stakeholders and research partners, is modernizing energy storage solutions to enable U. dominance in the global energy market. This innovative battery design offers a safe, cost-effective, and environmentally friendly solution for.
