- Bypass diodes avoid local high breakthrough currents of solar cells in the case of shading
- Voltage at a shaded cell is below voltage of a substring
- Electric currents of cell strings and bypass diode add up to mpp of the inverter
- → The bypass diode limits the dissipating power to the maximum.

The basic construction of a solar panel is relatively simple compared to a nuclear plant. The trick in solar is to get everything exactly and precisely right – specifications, manufacturing, transportation, and installation – over and over again. For example, a typical 200MW solar plant constructed. J-boxes from Shoals are small, weatherproof enclosures attached to the back of a solar panel. They house the electrical connections and components needed for integrating the panel into a solar energy system. The J-box applicator is an essential machine.
