## Overview

---

In order to evaluate the potential of renewable energy to replace fossil fuels by 2050, we developed and modeled nine scenarios involving three different levels of energy demand and three different levels of renewable energy development. ProCon presents the pro and con arguments to debatable issues in a straightforward, nonpartisan, freely accessible way. Natural resources—materials or substances found in nature that can be used by humans for personal or economic gain, even their survival—include water, minerals, forests, and. China's thermal power generation has the characteristics of high emission and high pollution. But too rapid expanding also results in. There are several prominent alternatives to solar power, which are important as coal, petroleum, natural gas, oil shales, bitumens, tar sands, and heavy oils are running out. Yes, humans have almost depleted all the reserves. The storage potential through wind farms and advancements in turbine technology have made this option increasingly viable.
