

# Switzerland commercial microgrids

## Overview

---

While microgrids offer many advantages, including greater resilience, energy independence, lower costs, and environmental benefits, their market prospects in Switzerland have been limited by high investment costs and regulatory hurdles. Microgrids are local power grids with intelligent control systems that can operate autonomously to increase the security of supply. They integrate renewable energies, electricity storage and load control to ensure grid stability and reduce the costs of grid expansion. Working with specialists at the Switzerland-based Schneider. The company specializes in providing strategic insights and data-driven analyses for transitioning to energy-efficient practices, which is essential for the development of microgrids. Their focus on cost/benefit assessments and quantifying CO<sub>2</sub> emissions further supports their role in advancing. As well as stabilising the grid, renewable microgrids are also attractive solutions for regions wishing to produce green electricity independently from the grid, saving potentially high cable laying and. They offer the added advantage of improving grid resilience when connected and can increase energy efficiency. Traditionally, centralized power generation plants produce electricity which is then transported by a transmission and distribution network to the end-user. This is a one-way delivery. Based in Zug, Switzerland, FlowGen offers wind, solar and storage-based microgrids and says their power can cost between 6 cents/kWh and 8 cents/kWh-without subsidies. - Wind and solar complement each.
