

Overview

Charging any Tesla with portable solar panels is significantly slower than using a Wall Connector. Even the Tesla Mobile Connector plugged into a 120 V receptacle or wall outlet in a house or any destination will likely deliver faster charging speeds due to a higher amps output. But it brings up a big, practical question: how long does it actually take to charge the thing from your solar panels?

The short answer is usually around 5 to 10 hours, but the real answer depends on a whole lot more than just the clock. It's a mix of sunshine, your gear, and what's happening. My PW no longer charging at max. Anyone else have this problem after app update?

My system was installed in April. Used to charge up to 5kw during peak. Yet, experiencing slow solar charging can be frustrating, limiting your energy independence. With the summer sun, that could be 30+ miles per day and 60+ over a two day hiking trip. So, even though it's not really a very practical option, I'm interested in how I might pull this off.

Tesla mobile photovoltaic panels charge slowly

My PW no longer charging at max. Dumping Kw into the grid

So someone mentioned this in the tesla motors club about this behavior. It could be some sort of adaptive charge algorithm. To be honest, I think I'd like better control of this and just charge ...
