

The power of photovoltaic panels can exceed the nominal

Overview

The power a module generates in real conditions can exceed the nominal power when the intensity of sunlight exceeds 1000 W/m^2 (which corresponds roughly to midday in summer in, for example, Germany), or when sun irradiation close to 1000 W/m^2 happens at lower temperatures. My victron mppt 100/50 in 12V mode says Nominal max is 700W, but down the bottom it says "If more PV power is connected, the controller will limit input power. What happens If I hook up 900Watts of solar to controller?

& This is the full 900watts noon summertime. Does it simple take in 700W & the. The nominal power is important for designing an installation in order to correctly dimension its cabling and converters. Discover how it is calculated and how it affects systems classification. Is this even possible?

The "nominal" power rating is based on Standard Test Conditions of irradiance and cell.

The power of photovoltaic panels can exceed the nominal

Nominal power (photovoltaic)

Overview
 Power output in real conditions
 Standard test conditions
 Units
 Conversion from DC to AC

The output of photovoltaic systems varies with the intensity of sunshine and other conditions. The more sun, the more power the PV module will generate. Losses, compared to performance in optimal conditions, will occur due to non-ideal alignment of the module in tilt and/or azimuth, higher temperature, module power mismatch (since panels in a system are connected in series the lowest performing module defines performance of the string it belongs to), aging factor, soiling and DC to AC conversion...
