

# What is the backplane glue of photovoltaic panels

## Overview

---

EVA film is a hot-melt adhesive film used in solar cells. It is not sticky at room temperature, but when heated to a high temperature and heat-pressed, it solidifies and becomes adhesive, becoming fully transparent. What is the use of solar backplane film Solar backplane film serves multiple essential functions in photovoltaic module construction, including: 1. Protection against environmental stresses, 2. It isolates the interior of the module from the external environment, realizes electrical insulation, and enables the module to operate outdoors for a long. The photovoltaic backplane of a solar module, also known as the backsheet, plays a crucial role in the overall performance, durability, and safety of the module. You need the right bonding materials for different panels and cells. They can also make recycling easier. Weather and recycling choices are important. TPT is the abbreviation for the composite material of “Tedlar film→Polyster→Tedlar film”. The reverse processing is also applicable whereby the EVA can be used to times longer than that of tr s he.
