

# What to do if the back sheet of photovoltaic panel is debonded

## Overview

---

Learn about the causes of cracks in solar PV backsheets, their impact on performance, and how to ensure durability with high-quality materials. One critical layer is the backsheet [1], which protects the internal components from environmental contamination. But what's really causing it?

Is it a bad batch of materials, or is something wrong on the production line?

Understanding the root cause is the difference between a quick fix and a chronic. Backsheet is the last layer at the back of the PV module and is made from a combination of polymers. The Backsheet protects solar panels against environmental damage (ultra-violet radiation, humidity and vapour penetration, dryness, wind, dust and sand) and ensure that panels remain electrically. If the layers of the backsheet are not bonded properly during manufacturing, they may start coming apart later. All product images shown are for representative purposes only.
