

# What to do if there is no voltage on the photovoltaic panel

## Overview

---

To troubleshoot this issue, you will need to test the inverter, the charge controller, and the solar panels to determine where the fault lies. It can be frustrating to find you don't have voltage from your solar panels, but the potential problems are relatively straightforward to diagnose as there can only be a few issues that cause the lack of power. Other possible reasons for low to zero power are a damaged PV module, poor wiring, shading and temperature higher than the ideal operating range. This issue can stem from various factors, such as shading, defective panels, or equipment issues. Check all connections for any loose wires or corrosion, which can inhibit functionality. Below is a list of a few things to keep in mind while troubleshooting solar systems.
